How can Microbiology testing Empower operations?

Microbiology testing is indispensable in the pharmaceutical industry to ensure the safety and quality of pharmaceutical sterile products such as injections, infusions, and ophthalmic solutions, as well as non-sterile products such as solutions, capsules, tablets, and ointments. It plays a crucial role in detecting and identifying harmful microorganisms, such as bacteria, viruses, and fungi, that may contaminate medications during production or storage. By conducting rigorous microbiological tests, pharmaceutical companies can prevent potential outbreaks, protect patients from infections, and comply with regulatory standards, guaranteeing the efficacy and integrity of their products.

Microbiology testing finds extensive application in the pharmaceutical industry across various stages of drug development and production. It is conducted on raw materials, active pharmaceutical ingredients (APIs), excipients, and finished products to assess the microbial load and confirm compliance with established quality standards. Additionally, microbiology testing is essential for environmental monitoring in manufacturing facilities, ensuring a sterile and contamination-free production environment. By performing microbial testing, pharmaceutical facilities can make informed decisions, implement proper controls, and provide safe and effective medications to patients worldwide.

TM Media, the Life sciences division of Titan Biotech Ltd., stands out as a trusted partner for Microbiology testing in the pharmaceutical industry. With high-quality and reliable microbiology testing products, we ensure accurate and efficient microbial identification and analysis. Our state-of-the-art testing solutions, including Dehydrated Culture Media, Ready-to-Use Culture Media, Surface Sampling Swabs, Rapid Detection Kits, and Advanced Air Samplers, enable pharmaceutical companies to streamline their testing processes, reducing turnaround times and increasing productivity.

Safeguard Quality

In the pharmaceutical industry, maintaining a clean and sterile environment is paramount to ensuring product quality and patient safety. To achieve this, microbial testing is performed. Microorganisms can also alter the chemistry and pharmacology of drugs and other products, which breaks down the active ingredients and impacts the product's efficacy.

In a manufacturing facility, key sources of contamination are the air, equipment, surfaces, or even the person performing the activity. And to avoid these contaminations, the manufacturing facility should regularly monitor the air, equipment, surfaces, or personnel wearables.

Microbial Limit Test

The Microbial Limit Test (MLT) is performed to assess how many and which of certain viable microorganisms are present in non-sterile products that range from raw materials to finished products.

Sterility Testing

A Sterility Test is a test that critically assesses whether a sterilized pharmaceutical product is free from contaminating microorganisms. The Sterility Tests are intended to detect the presence of viable forms of microorganisms in or on the pharmacopoeial preparations.

In Process Validation

Process Validation is the collection and evaluation of data from the process design stage throughout production, which establishes scientific evidence that product performance is consistent from batch-to-batch and unit-to-unit.

Media Fill

The Media Fill evaluates the aseptic assembly and operation of critical sterile equipment, qualifies and evaluates the operators' technique, and demonstrates that the environmental controls are adequate to meet the basic requirements for producing a sterile drug through aseptic processing.

Environmental Monitoring

Microbiological Environmental Monitoring is a method of demonstrating the microbiological quality of a controlled environment and detecting changes in a timely manner. It involves regular monitoring of the air, equipment, surfaces, or personnel wearables in the clean room area.

Water Testing

Since pharma facilities and research laboratories use sterile tools and chemical agents in order to maintain sterility, bulk water is expected to be treated in multiple units before use. Finally, after various treatment processes, purified water and water for injection are prepared and used.

Ready-to-Use Culture Media Plates

Ready-to-Use Culture Media Plates for Environmental Monitoring of air, surfaces, and personnel and assurance of reproducible detection of microorganisms in most critical areas like isolators and cleanrooms in pharmaceutical industries.

Absolute Secure

Absolute Traceable

Absolute Firm

Sterile Production

Absolute EM Plates are prepared with absolute quality control in sterile conditions in a fully automated plant without any manual interference. Sterility assurance level SAL 10^6 is maintained and checked at regular intervals.

User-friendly Packaging

The plates are γ -irradiated and triple-wrapped in transparent packaging. Includes the permeable film & gamma indicator on the descriptive label. Details such as expiry date, product name, code, and batch number are printed on the edge of the plate. The user has the advantage of clarity while reading colonies on the colony counter.

Quality Check

Each plate is manufactured with precise formulation and uniform distribution, ensuring consistent growth and accurate interpretation of microbial cultures.

Proofs of Compliance

Certificate of Analysis (COA), Stability Data, Instructions for Use (IFU), Transportation Study, Gamma Irradiation Certificate, Packing Integrity Test Report, and Microbial Validation.

Variants

The Plates are available in two sizes: 90 mm for passive and active air sampling applications and 55 mm contact plates for microbiology testing of surfaces and personnel.

Microbiological Lab Equipments

Microbial Air Monitoring Systems (Air Sampler) & Accessories

TME 005-MICROBIAL AIR MONITORING SYSTEM

The equipment uses isokinetic sampling, which delivers uniform airflow across the surface of an agar plate at high velocity for quick analysis. A specified volume of air is passed through small holes or slits onto a Petri Plate containing Culture Medium for a specified period of time. After the cycle is complete, the plate is removed from the Air sampler and incubated, and visible colonies are counted to determine the level of contamination. This will result in the number of viable microorganisms present in each liter of air in the area being calculated.
